

CENSUS OF INDIA, 1941

VOLUME XII

SIND

TABLES

by

H. T. LAMBRICK, I.C.S.

Superintendent of Census Operations, Sind

PUBLISHED BY THE MANAGER OF PUBLICATIONS, DELHI
PRINTED BY THE MANAGER, GOVERNMENT OF INDIA PRESS, SIMLA
1942

Price : Rs. 10-10-0 or 16s, 6d.

*List of Agents in India and Burma from whom
Government of India Publications are available.*

NOTE

The census enumeration was carried out in full according to plan but the Government of India decided to restrict the tabulation for British India. Consequently the tables in this volume cover less than half the contemplated range and offer in effect only the distribution of the population by community and by province or state, district, tehsil and town.

Opportunity has been taken however to sort wherever possible the 1/50 random sample taken in every area.

2. The slips in which the remaining unsorted information is to be found are stored in each province against a possible reopening of tabulation in happier circumstances.

I—AREA, HOUSES AND POPULATION

1. *Area*.—It will be observed that the 1941 figure for the total area of the province differs from that given in the corresponding table for 1931.

No change in the external boundaries of the province has taken place, and the difference is simply the effect of recent revision operations by the Survey of India.

Considerable changes in the internal divisions of Sind have occurred since 1931, due to the creation of a new district, Dadu. It was formed of parts of the old districts of Larkana and Karachi; the new Larkana district absorbed part of the old Upper Sind Frontier district, while the latter gained some trifling areas from Sukkur and the old Larkana district.

These changes make comparison with the statistics of former years a matter of considerable difficulty, as the boundaries of a number of talukas have undergone alteration.

2. *House*.—In 1921, Mr. Sedgwick the then Bombay-Sind Provincial Superintendent of Census observed “The Census House is a hopeless hybrid between the family and the building”. This I consider to be in great measure inevitable, owing to the diversity in the manner of life among the population.

The definitions adopted for the Sind census of 1941 were as follows:—

Building.—“A roofed structure, made of any materials, which is likely to remain in existence on the same site during the census period, whether used for purposes residential or non-residential: being under one undivided roof, or under two or more roofs connected *inter-se* by a subsidiary roof.”

House.—“A building or part of a building which is and is likely to remain during the census period, a dwelling regularly inhabited by a human being or a family living together in one common mess, with their dependents and resident servants.”

It cannot be said that these definitions were completely satisfactory. An enumerator brought to my notice the case of a family who regularly lived under a large tree, surrounded by *kanats*; and the degree of permanence on the spot of “buildings”, and the degree of permanence of their habitation, often proved baffling questions.

On the whole, however, the main object of recording separately the essentially house-dwelling population and the essentially fluid or nomad population may be considered to have been achieved.

The total number of persons recorded as houseless was 80,689, or 1·8 per cent of the entire population. These elements include seasonal and other temporary immigrants from the countries to the north-west and south-east; fakirs of many descriptions; and wandering tribes such as Ods, Bhats, Karias (wandering blacksmiths) and Wagris.

Three per cent of the population in the districts subject to seasonal immigration were recorded as “houseless”, the average in other districts being 1½%.

Average population of a “house”.—As indicated above, a “house” might be anything from a town mansion occupied by a joint family comprising thirty or forty souls, to the “pish”-mat shelter of a Baloch herdsman.

The average number of persons per house in British Sind was a little under five in the urban areas, and 5·8 in the rural areas. The latter show a higher rate than the former in every district: and it is also noteworthy that it is higher in the Upper Sind districts than in those of Lower Sind, attaining the high average of 7·7 in the rural area of Upper Sind Frontier district.

This is probably due to the tendency among rural Muslims, particularly Balochis, for a family to continue to live together after the sons have grown up and married.

In Khairpur State the average in both urban and rural areas is higher than the average in British Sind, being respectively 5·7 and 6·3 persons per house.

Distribution of the population between urban and rural areas.—Municipal and cantonment areas, which alone were reckoned as urban areas, numbered 29 in 1941 as against 30 in 1931. During the decade, two municipalities (Bubak and Keti Bunder) were abolished and two (Dadu and Nawabshah) constituted. The two latter however were treated as towns in the 1931 census.

A new cantonment, Drigh Road, came into existence: but for the purpose of this table the cantonments of Karachi, Manora and Drigh Road have been included with Karachi municipal area as Karachi City, and Hyderabad cantonment with Hyderabad municipal area as Hyderabad City.

The number of towns thus appears as 26.

The new classification of rural units of population by "villages" and "dehs" will be explained in the preface to Imperial Table III.

Of the house-dwelling population of Sind, nearly 20% live in urban areas and a little over 80% in rural areas.

The corresponding percentages in 1931 were 18% and 82%.

The urban : rural ratio calculated on the population living in towns of 5,000 and over is 1 : 4.

The percentage rate of increase of the urban and rural population were respectively 27.6 and 14.3 for the decade 1931-41. In the previous decade they were 27.9 and 16.6.

This steady continuing tendency for the population of the towns to increase at a higher rate than the country may be considered as "urbanization" only in a very limited degree, and the whole subject will be dealt with in detail in the explanations to Imperial Tables III and V.

Density.—Sind now has an average density of population of 94 souls to the square mile, as against 81 in 1931.

The district rates follow in the same order in this respect as in every census since 1918:—viz., Larkana (179), Hyderabad (170), Upper Sind Frontier (151), Nawabshah (149), Sukkur (125), Karachi (85), Dadu (53) and Thar Parkar (43).

More than two-thirds of the area comprised in Dadu district is barren hill country and a similar proportion of Thar Parkar district is sandy desert.

About one-third of Sukkur and Karachi districts is barren waste; sand, bare hills, or salt flats.

Khairpur State is in this respect on practically the same footing as Thar Parkar district.

The average density of "Sind" proper, *i.e.* the country irrigable from the river Indus, may be estimated at 165 souls to the square mile.

II—VARIATION IN POPULATION DURING FIFTY YEARS

The creation of Dadu district after the census of 1931 has made it necessary, for the purpose of this and other comparative tables, to adjust the previous census figures of population of the districts which contributed to its formation, as though Dadu had always had an independent existence. The area transferred was made up not only of whole talukas, but also parts of talukas, and the population figures for the earlier years are therefore inevitably rough approximations : Karachi, Larkana, Upper Sind Frontier and Sukkur are all thus affected, though in the latter the change was all but negligible.

It may also be mentioned that Nawabshah district came into existence between the 1911 and the 1921 census, and occasioned some rearrangement between Hyderabad and Thar Parkar districts.

Subject to the above considerations, the figures in the table speak for themselves. They show a fairly steady rate of increase all over the province, with a single decade 1911-1921 in which the population suffered a set-back due in the main to the heavy mortality in the influenza epidemic of 1918-19.

The gain in population in the whole province during the last fifty years amounts to nearly sixty per cent over the figures of the 1891 census.

Turning to the districts, we find that Karachi and Upper Sind Frontier have increased by nearly 100% in the half century.

In the former, this is due almost entirely to the growth of Karachi City itself : the increase in Upper Sind Frontier on the other hand results from steady development of irrigation facilities in a tract bordering upon a country dependent almost exclusively on precarious rainfall ; in the last three decades, the change over in this district from approximately 1/3 rice and 2/3 dry crop cultivation, to the reverse proportions has attracted cultivators.

The steady growth of prosperity in Khairpur State, which passed during these fifty years from a completely feudal organization, under His Highness Mir Ali Murad, the contemporary of the late rulers of Sind, who like them kept much of the best land in the State under his shooting preserves, to the well administered and prosperous conditions of the present-day, is reflected in the increase of nearly 140%.

Nawabshah and Thar Parkar districts, which have both seen vast improvements in rail communication and irrigation in the half century, show a gain of about 60 per cent.

Hyderabad district has increased by over 50 per cent, Sukkur by about 46 per cent, Dadu by a little over 40 per cent and Larkana by 35 per cent.

The latter district, comprising roughly the tract known as Chandukah in former days, has been perhaps the most highly developed part of the province for over a century, and has always been comparatively thickly populated.

Taking into consideration the two last decades we find that the percentage rate of increase in 1931-1941 has fallen somewhat from that recorded in the previous decennium, the provincial-figures being 16.67% as against 18.53%. The only districts which show a higher rate of increase in 1931-1941 than in 1921-1931 are Karachi and Thar Parkar ; and in the former this is due entirely to the growth of Karachi city, the tempo of which was phenomenal during the decade.

Scarcity conditions in the countries to the south and east of Thar Parkar district in the years immediately preceding the census of 1941 undoubtedly contributed a substantial amount to the increase in its population by 24%—the highest in British Sind—recorded this year. But this district has also benefited from the introduction of barrage irrigation more, probably, than any other ; and much of this immigration is likely to be permanent.

The remarkable advance in the rate of increase in Khairpur State, from 17.63% in 1921-1931 to 34.6% in 1931-1941, is due largely to the development of cultivation after the introduction of the Barrage system : numbers of people who had left the State previously for various reasons having now returned to take up new lands.

The effects of the Barrage irrigation in particular areas will be discussed under Provincial Table I, but some general observations may appropriately be made here.

The total area cultivated in the province of Sind in the year 1931-32 the last season before the Barrage canals came into operation, was approximately three million acres, of which about two million were in what subsequently became the Barrage Zone, and one million in the Non-Barrage Area.

By 1937-38, well over three million acres were cultivated in the Barrage Zone alone, while the Non-Barrage Area showed a figure of nearly a million acres.

In 1938-39, the last season for which figures are available, the total area Barrage and Non-Barrage in the province under cultivation was four million two hundred thousand acres : an increase in eight years of more than one million one hundred and forty-three thousand acres, or over 37% of the 1931-32 figures.

This vast extension of cultivation has occasioned a demand for haris which has attracted numbers of people from the countries adjacent to Sind, in the north-west, and the south-east. It has also been responsible for population movements within the province. These phenomena are dealt with in the remarks appended to Imperial Table XIV and Provincial Table I.

As to the natural increase in the indigenous population during the period 1931—1941, it is difficult to say much. It may be presumed to have been fairly steady, at some figure in the neighbourhood of 10% per annum. There have been no serious epidemics during the decennium, the condition of public health being reported as either good or satisfactory for every year in the decennium.

The rate of infant mortality has remained fairly steady at about 120 deaths per 1,000 registered births, which compares favourably with most provinces in India. It must however be admitted that vital statistics in Sind are less accurate than in most other provinces, so that it is not safe to draw very definite conclusions on this point. In fact, the likelihood of the true rate being far higher is apparent when we find that infant mortality in Karachi City, with all its efficient Health Services, and where the vital statistics are tolerably accurate, amounts to nearly 150 per mille.

Improvement in the style of living has been noticeable only among the middle and upper classes ; but the condition of the lower classes may be considered as fairly satisfactory, judged by the regrettably poor standard which alone can be applied as a criterion. Sind has never been a country where people are likely to starve, and fluctuations in the price of staple foods have not much effect on the condition of the hari class who grow these grains, and retain from their share of the crop sufficient for their own use ; while money crops like cotton have commanded prices sufficiently high to give the hari a fair margin from the sale of his produce.

These remarks must of course be taken as generalisations, which have many occasional and local exceptions. Indebtedness, bad cultivation, failure of particular crops, litigiousness, extravagance, and similar factors all tend, separately or combined, to produce distress in varying degrees.

On the whole, it may be held that the people of Sind prospered during the decade 1931-1941.

III--TOWNS AND VILLAGES CLASSIFIED BY POPULATION

I—*Villages*.—One important innovation introduced for the Sind census of 1941 was in the classification of "villages".

The basis of the 1931 compilation under this table was the "revenue village", known in Sind as the "deh". These were classified, inclusive of "inhabited places", by population: *e.g.*, under 500, over 500 but under 1,000, and so on.

Sind returned 5,352 revenue villages, and 5,180 inhabited towns and villages in 1931, 2,841 of these having population under 500 souls.

The second figure is quite misleading, giving no indication of the manner in which Sind's rural population lives and is distributed; on which head accurate information is necessary for Sind, and interesting in comparison with other provinces. The error was due to the attempt to treat Sind on the lines of the Bombay Presidency.

The average revenue village in the Deccan is roughly about the same size as the "deh" in Sind: but almost all the people who till its fields actually live in houses in the "gaothan", which in nine cases out of ten is the only residential place in the revenue village limits.

In Sind it is entirely different. There may be half-a-dozen sanctioned village sites within the deh, some of which may be inhabited, others deserted: but in addition there may be dozens of clusters of huts in or on the borders of the fields, and also single huts, which the peasantry are allowed to build on or near the land they cultivate, by the zemindar who owns it.

It was obviously impracticable to recognize each such agglomeration of huts as a "village" for census purposes: indeed, many of them have only an ephemeral existence in one spot, a fluidity characteristic of the province. But as the usual residential unit, whether permanent or not, is much smaller in Sind than in Bombay, it was decided to adopt a group of 20 houses standing on the same spot, or a community of 100 souls, as the lowest number to qualify for classification as an "individual village".

The inhabitants of all hamlets and clusters of huts, etc, mustering less than 100 inhabitants, were added together and classed as "other scattered population of the deh".

The deh thus remains the standard unit for dealing with the rural population, but may comprise within its boundaries several "individual villages".

As a result of this classification, we find the number of "individual villages" containing more than 100, but less than 500 souls, to be 5,885 in British Sind, and 282 in Khairpur State. The corresponding number of dehs in which the balance of the house-dwelling population is less than 500, after that of any individual villages within their limits has been deducted, amounts to 4,598 for Sind, and 262 for Khairpur State.

The population living in these small residential units does not fall far short of half the total house-dwelling population of the province, amounting to 2,177,135 out of 4,535,008 in British Sind, and 142,669 out of 305,787 in Khairpur State.

I would here invite a comparison with the figures given in statements No. 8 and 13 on pages 39 and 43 of the Bombay Presidency Census Report of 1931, which will immediately reveal how distorted is their picture of the distribution of Sind's population, based on the "revenue village" alone.

Looking forward in the 1941 table, for British Sind, we find four dehs figuring in the 2,000 to 5,000 class: which means that apart from any individual villages they may contain, their scattered population still attains this figure. This calls up a picture of very extensive wild tracts, thinly peopled, and as a matter of interest I may identify them: part of the *kohistan* of Tatta taluka: Deh Nind, in the Kharo tract at the mouth of the river Indus in Shahbunder taluka: Bakar Jagir, in the *registan* of Rohri taluka: and Deh Hathungo, a vast tract in the *registan* of Khipro taluka.

Similarly, in the 5,000--10,000 class, we find as a deh another and very extensive part of the *kohistan* of Tatta taluka.

Each of these tracts is inhabited by a class of people typical of the locality, living in scattered huts or tiny hamlets.

Their total population, of 18,824, may be reckoned as belonging in reality to the smallest class, to which they may be added for the purpose of taking a dividing line at the figure of 2,000: we then find that 3,334,404, or close on $\frac{3}{4}$ of the house-dwelling population of British Sind lives in places containing less than 2,000 inhabitants.

The number of individual villages, towns and cities containing each more than 2,000 inhabitants is only ninety-nine in British Sind, and contain a population of 1,138,739 souls.

In Khairpur State, division in the same manner reveals that out of a house dwelling population of 302,167; 258,463 or over five-sixths, live in places with a population of less than 2,000; and 43,701 in nine places with more than 2,000 inhabitants each.

II- Towns.—The term “town” was applied to all municipal and cantonment areas. Some of the former have much smaller populations than a number of the rising villages of the Barrage Area, and other flourishing tracts, and I was prepared to include as towns such places, having urban characteristics and more than 5,000 population: but for administrative reasons it proved convenient to adhere to the old classification.

Villages in the 5,000 to 10,000 class which are not municipalities, and thus not classified as towns, are as follows:—

<i>Hyderabad</i>	Tando Jam Mathi
<i>Larkana</i>	Shahdadkot
<i>Nawabshah</i>	Kandiaro
<i>Sukkur</i>	Khanpur Pir-jo-Goth
<i>Thar Parkar</i>	Mithi

In Khairpur State, Khairpur Notified Area, and Gambat, were classed as towns.

III. Cities.—For the purpose of this table, the three cantonment areas in and in the vicinity of Karachi Municipal district have been treated as component parts of Karachi City; and Hyderabad cantonment as part of Hyderabad City.

IV. For the purposes of this table, the floating population is shown separately from the populations gathered under columns, 5, 7, 9 etc. This element however is included in town population for the purposes of Imperial Tables IV and V and hence slight differences in total.

IV. CITIES CLASSIFIED BY POPULATION WITH VARIATION SINCE 1891

(v) The first steps towards industrial development, hitherto virtually unknown in Karachi, were taken in the decade. More important than the opening of factories, however, was the growth of Karachi's fishing industry, stimulated by an increasing demand for Karachi fish all over north-west India.

Many Makrani fishermen have settled in the Lyari Quarter in the past few years.

(v) The decade opened in the depth of the world-wide trade depression : but the entrepot trade on which the prosperity of Karachi was founded has benefited considerably from the development of the Barrage Area, and from extension of irrigation in the Punjab and Bahawalpur. The number of bales of cotton annually exported through Karachi has risen by nearly 100% on the average, since 1932. In addition, exports of wool, hides and skins and iron ore, all show substantial increases.

Imports of commodities such as piece-goods and sugar have naturally declined in view of the present tariff policy : but the carrying and forwarding business of Karachi is thriving : and vast development in agency business of every kind has taken place during the decade. These factors have contributed not a little to the growth of the city's population.

There seems no reason to suppose that these factors in the growth of Karachi's population will cease to have an important influence in the course of the next ten years. On the contrary, others are likely to develop. The only limiting factor would seem to be the water supply, which cannot be considered adequate even to the present population. But if the Indus Water Supply Scheme is undertaken and completed in the next six or seven years, the growth of Karachi may become even more rapid. Given virtually unlimited water, no place could be found better suited for development of the textile industry, and it is not unreasonable to contemplate a time when Karachi, with a huge cotton growing tract almost at its back-door, may compete successfully with Ahmedabad and Bombay.

V—TOWNS ARRANGED TERRITORIALLY WITH POPULATION BY COMMUNITIES

The figures presented in this table, when compared with the corresponding figures for 1931, and with those in Provincial Table 11 for these years respectively, throw more light on general conditions in the province during the decade than can be obtained from any other compilation of the 1941 census.

The number of places classified as cities increased by one ; it was anticipated that Hyderabad's population would exceed one lakh : it has in fact surpassed this figure by a large margin.

The number of places classified as towns was reduced by one : the municipalities of Bubak and Kettibunder having been abolished after the 1931 census, while Drigh Road Cantonment came into existence. Municipalities were constituted at Nawabshah and Dadu during the decade, but these places had been classified as towns in the 1931 census.

In discussion of the changes in the urban population, the strictly military areas will be excluded from consideration.

The total urban population of the province increased by 192,396 souls, or 27.5 percent. The increase during the decade 1921—1931 was 156,210, or 29%.

The tendency towards urbanization would appear therefore to be losing rather than gaining strength in the province as a whole.

But when we consider cities and towns individually, it is evident that the movement has attained unprecedented vigour in particular directions. The magnetic influence of Karachi City was never greater ; Hyderabad is obviously drawing upon the mofussil for a considerable proportion of its increase : but their development is eclipsed by that in the "young" towns in the Barrage Area, Nawabshah and Mirpurkhas.

The former has gained by 10,486 and the latter by 9,413 representing 149% and 92% respectively.

Other towns in the Barrage area which have developed greatly in the decade are

Dadu
Tando Allahyar
Ratodero
Shahdadpur
Tando Adam

and Khairpur, in Khairpur State ; while Nala, Kambar, Larkana, and Garhi Yasin are all progressing.

Towns outside the Barrage area which are evidently thriving are Tando Mahomed Khan and Jacobabad.

The following must be classed as decaying towns :—

Sehwan
Matiari
Nasarpur
Tatta

These have all suffered from the attractive influence of Karachi and Hyderabad. The three last named are centres of the handloom weaving industry, which is passing through hard times : and the trade formerly contributing to the prosperity of Sehwan and Tatta has shifted to other centres.

The position may now be examined from another aspect.

It is a common place that in Sind the indigenous Hindu population, *i.e.*, the Lohanas, Bhatias, and allied races, tend to live in the large villages and towns ; while the Muslims are predominantly dwellers in small villages and hamlets.

This distinction is becoming more sharply defined : for while there is a strong centripetal movement among Hindus, a centrifugal tendency has begun among the Muslims.

The following statistics reveal the manner in which the distribution of population between town and country is changing :—

Total and percentage increases, 1931-41

- (i) Hindu urban population:—over 1½ lakhs, or by 40%
- (ii) Hindu rural population:—a little over one lakh, or 15%
- (iii) Muslim urban population:—a little over one quarter of a lakh, or 9%
- (iv) Muslim rural population:—over 3½ lakhs, or 14%

Proportions of Hindu urban and rural population to their total population:

- (a) 1931—Urban 36.9%. Rural 63.1%.
- (b) 1941—Urban 41.6%. Rural 58.4%.

Proportions of Muslim urban and rural population to their total population

- (c) 1931—Urban, 10.2%. Rural 89.8%.
- (d) 1941—Urban, 9.8%. Rural 90.2%.

The Hindu figures include, for 1931 the "depressed classes" and for 1941 the "scheduled castes."

In Sind, the latter term includes the various Bhangi castes and the Menghwars, and very few others. Of these, 11.16% live in towns and 88.84% in the mofussil: and if we separate them from the "other Hindus", it will be found that almost half of the "caste Hindus" live in towns: the figures for the urban and rural areas amounting to 48.52% and 51.48% respectively of their total population.

It may be added that Bhils and Kolis, who are considered as "Caste Hindus" in Sind, form a very substantial proportion of the Hindu community dwelling in the rural areas of Thar, Parkar, Hyderabad and Nawabshah. Their numbers include many immigrants from Cutch, Marwar, and adjacent countries, but the majority hail from the Thar within the limits of the province. They are comparatively speaking a recent and unstable element in "Sind" (i.e. the valley of the Indus) and they remain even more sharply distinguished from the indigenous Sind Hindus (Lohanas, etc.) than the immigrating Balochis and Brahuis from the indigenous Sindhi Muslim population.

Some interest therefore attaches to the result of deducting the totals of Bhils and Kolis from the figures for Hindus in the urban and rural areas. 7,205 Bhils and Kolis were recorded in cities and towns, and 176,369 in the rural areas.

We are left with 494,399 Hindus in the urban areas, as against 355,771 in the rural areas: in other words, 58% of the Sind Lohana and allied Hindu population live in towns as against 42% in the country.

This element is not being recruited to any appreciable degree from outside the Province. Hindu immigrants into Sind are mainly Cutchis, Kolis, Bhils, and Menghwars, all of whom tend to live in the villages rather than the towns, with the possible exception of the first named.

It is therefore clear that the huge increases in the Hindu community in towns, e.g. 150% in Nawabshah, 90% in Mirpurkhas, 70% in Dadu and Tando Allahyar, 50% in Karachi, Jacobabad and Shahdadpur, are made up mainly by migration from smaller towns and villages in Sind.

If the village tables could be compiled and compared with those of 1931, the full extent of the process would be apparent: for non-municipal places such as the head-quarters of talukas, large villages at railway stations, and those at which there are Police thanas, are also almost all gaining Hindu settlers migrating from the small mofussil villages where they had lived for generations.

The causes for this movement have been discussed in the introduction.

The area irrigated by inundation canals in the tract now commanded by the Barrage was twenty million acres in 1931-32. It has risen under the Barrage to thirty-two million acres. The average annual acreage under cotton and wheat respectively during the previous decade have been almost trebled and quintupled in recent years.

This vast extension of cultivation occasioned a continuous and urgent demand for more "haris". In the districts to the south-east of the province, it was supplied in great part by Kolis, Bhils, Cutchis and similar Hindu classes, many of them immigrants from Rajputana, Gujarat and Cutch, as mentioned above.

But here too, and more particularly in the north and west of the province, Muslim cultivators are much in demand ; and it seems evident that many are drawn from the classes who previously lived by casual labour in towns. Under perennial irrigation, the land offers a comparatively secure means of livelihood ; and the shortage of Haris has had the effect of improving their economic position in some respects. A zemindar will think twice before he turns a man off his land : he may on the contrary have to give concessions in order to keep him.

Again, the throwing into the market on easy terms, of vast quantities of land to which water can be brought without anything approaching the outlay on karias, etc., required in pre-barrage days, must have tended to encourage Muslims, who have previously pursued other avocations in towns, to set up as small landholders.

To sum up, it appears that the effect of the introduction of Barrage irrigation has been to attract Muslims out of the towns on to the land ; and in some degree to induce Hindus previously living in small villages to concentrate in the towns and larger villages which are handling the growing transit trade in agricultural produce.

Of the other communities, the Sikhs show remarkable increases in Dadu, Hyderabad, Karachi, Larkana, Nawabshah, Shahdadpur, Tando Adam, Mirpurkhas, Jacobabad and Khairpur Mirs.

Their numbers in the towns in Sukkur district on the other hand have decreased, except in Shikarpur. These changes are probably connected with the demand for technical men—misters, electricians, and so on : it is well known that Sikhs are peculiarly skilful in matters connected with engineering. The fall in their numbers at Sukkur and Rohri may be ascribed simply to the completion of the barrage which was under construction in 1931.

On the other hand, the towns where their numbers have increased (leaving the cities of Karachi and Hyderabad out of consideration), have all developed electric lighting or factories since the barrage opened.

There do not seem any remarkable developments among the other communities.

Towns in Khairpur State

The town of Gambat was on this occasion limited to the area built over, and excluded the rest of the deh. This probably explains the apparent fall in the number of Muslims ; this town is in fact thriving.

The remarkable increase in the population of Khairpur Mirs is to be ascribed largely to the devastation of a number of villages in the vicinity, including Lukman, by seepage from the Rohri canal. A special colony has been laid out for immigrants from these villages.

The trade of the town has moreover benefited greatly from the introduction of barrage irrigation in the State.

XIII—COMMUNITY

"Community" has been adopted as a more suitable term than "religion" for this table, which however corresponds in the main with 1931 Imperial Table XVI, but assumes a much less elaborate form.

Hindus—Hindus are now divided into "scheduled castes" and "others", instead of the old division of Hindus into Brahmanic, Arya, and Brâhma. In 1931, the "depressed classes" which correspond fairly closely with the "scheduled castes" were not shown separately in the table for religion, but appeared in Table XVII (Caste, Tribe, Race or Nationality).

Tribes.—The "tribals" of the 1931 Table XVI (religion) were the primitive people who were understood to worship Animistic Deities distinct from the Hindu Pantheon.

The "Tribes" in the 1941 community table are in Sind exclusively Thakurs, who are classified as a primitive aboriginal caste in Sind, though there would be equal justification in including the Bhils, Kolis and similar peoples of Eastern Sind.

In 1931, the class "Aboriginal and Hill Tribes (Primitive)" under Table XVII included Bhils, Dhodias, Dablas, Koli Mahadevs, and Konkas, as well as Thakurs. All but the latter have been placed with "Other Hindus" in view of the caste classification issued under the Bombay Government G. R. No. 9330 (G. D.) of 3rd December 1934. There does not seem sufficient justification for drawing this distinction between Thakurs on the one hand and Bhils and Kolis on the other. The numbers of the two latter are however recorded in 1941 Table XIV.

It will be observed that the number of persons recorded as Thakur has increased from 6,317 in 1931 to 56,519 in 1941. Allowing that immigration may be responsible for part of this, it must also be presumed that numbers of these people returned, or were recorded by, some other name in 1931.

Hindus—Scheduled Castes.—The "Depressed Classes" in 1931 Table XVII amounting to 99,551 included Menghwars, Bhangis, Mochis, Mahons or Dheds, and a few others. The same castes were enumerated as "scheduled castes" in 1941; but their numbers were found to have nearly doubled, reaching the figure of 191,634. Of these 94,064, or nearly the provincial total of 1931, were returned from Thar Parkar District.

Leaving aside possibilities of less or more accurate record, it may be assumed that a considerable number of Menghwars, at least, recorded in Sind were immigrants from Marwar, and northern Gujarat, countries which for some years past have suffered from scarcity.

Muslims.—Sunnis and Shias are no longer tabulated separately.

Christians.—The sectarian divisions have given place to the main community divisions, into Indian Christians, Anglo-Indians, and Others (mostly Europeans).

Sikhs.—The figures of Sikhs have increased from 18,505 in 1931 to 31,011 in 1941. Immigration has taken place to some slight extent, but the rise is in the main due to more accurate enumeration. The leaders of the community in Sind have long been dissatisfied with the census returns for Sikhs and on this occasion did considerable propaganda to ensure that every follower of Guru Nanak would see that he was recorded as a Sikh.

There are in Sind a considerable number of Sahejdhari Sikhs; that is, people who have adopted the Sikh religion but in their social customs remain almost if not quite indistinguishable from Hindus. Many members of the Amil community in Karachi, Hyderabad, and Sukkur are Sahejdhari Sikhs.

At the other end of the scale are the Labana Sikhs, who are very backward and poor, living mainly by weaving grass mats and labour; they however observe the five "Kakas" and are perfectly distinct from the Hindus. It was the complaint of Sikh leaders in Sind that Hindu enumerators had in previous years written up these ignorant people as Hindus; and that such a tendency may well have existed was evident to me, when on one occasion I actually found a Hindu enumerator putting down two recently arrived Punjabi Sikhs—Khalsas as "Hindus".

Jains.—The increase in the number of persons returned as Jains, from 1,144 in 1931 to 3,087 in 1941 may perhaps be due to new arrivals in Karachi of members of that community from Gujarat; but much more probably results from more accurate enumeration.

Christians.—In view of the new classification, comparison of the 1931 figures with those of 1941 will not reveal which Christian "community" is mainly responsible for the large increase of 5,076, or over 33%, above the totals of the former year.

The decreases in Hyderabad and Sukkur are mainly due to changes in the composition of the garrison at the former place, and the completion of the Barrage works at the latter.

The increase in Thar Parkar may perhaps be due to conversions among the local population : but the numbers involved are trifling.

The increase in Karachi results mainly from the expansion of the Fighting Services stationed there : the numbers of European personnel being greatly above normal strength.

Parcels, Jews, and Others.—No increases or changes worthy of remark appear to have taken place among these communities.

Relative strength of the Muslim and Hindu communities in Sind

It must be admitted that information on this subject has become, for most people in India, incomparably the most interesting product of the decennial census.

The subsidiary table reproduced herewith discloses that the proportion of Muslims to the total population has declined from 76% in 1901 to 71% in 1941. The proportion of Hindus (including Scheduled Castes) has increased in the same period from 23% to 27%. "All other" communities, though relatively unimportant, have improved their position from 1.4% to 2.1%.

The redistribution of districts after 1931 renders it rather difficult to assess the change in balance in each part of Sind. Immigration is of course a disturbing factor, as it is quite impossible to determine what degree of permanence it may be assumed to have. This problem is further discussed in the preface to Table XIV.

However this may be, the proportions of Muslim and Hindu population respectively to total population in particular districts may be briefly indicated.

As before, the predominance of Muslims is greatest in Upper Sind Frontier, where there are nine of them for every one Hindu : and least in Thar Parkar, where the two communities are almost even in numbers.

In Hyderabad there are rather more than two Muslims to one Hindu, and in Sukkur five Muslims to two Hindus. In Nawabshah three to one, in Larkana and Dadu, five to one.

If these figures are presented in the form of percentages, and compared with those for 1931, we find that in one district, Upper Sind Frontier, the Muslims have gained ground at the expense of Hindus, but that in the south-eastern districts the reverse is the case, and to a greater degree : thus :—

								Muslims	Hindus
Upper Sind Frontier	1931	89%	10%
				1941	90%	9.4%
Dadu, Larkana, and Sukkur	1931	} Steady	} Steady	
			1941			
Thar Parkar	1931	52%	47%
				1941				50%	48%
Hyderabad	1931	69%	30%
				1941				67%	32%
Nawabshah	1931	76%	23%
				1941				75%	24%

In Khairpur State, as in Upper Sind Frontier, Muslims have improved their position. They are in the proportion of over five to one Hindus : the percentages of the two years are as follows :—

								Muslims	Hindus
Khairpur State	1931	82%	17%
				1941				83%	16%

In connection with the subsidiary table 2, showing the distribution of the main communities, it may be mentioned that in the census of 1891 Muslims and Hindus were in the proportions of nearly four to one : in that of 1881, they had appeared as six to one.

This sudden decline, as it appears, in the Muslim predominance, is really due to the fact that in 1881, 127,000 persons were recorded as Sikhs : of whom more than one lakh should almost certainly have been shown as Hindus.

In this connection, some interest attaches to the figures of the census of the Province of Sind held when Sir Bartle Frere was Commissioner in February 1851. The percentages of the Muslim, Hindu and "Other" population to the total population were then 74%, 21%, and 5%.

This census was not, of course one of the Imperial Series, and the degree of accuracy which it attained cannot be estimated at this distance of time.

One test we can apply : and that is to compare the sex-proportion of the population with that recorded in subsequent censuses. This was marked upon in a note as follows :—

"The great disproportion between the males and females in this schedule may be in part accounted for by the dislike of orientals and especially Mussalmans, to speak of anything connected with the *haram*. It is probable that not a few wives and female attendants are thus passed over".

Such a tendency to conceal might be assumed to have decreased with the growth of education : but the number of Muslim females to one thousand Muslim males in Sind actually appears less in 1931 than in 1851 : namely 781 as against 787. Among Hindus, the 1851 census showed 810 females to 1,000 males, the figure for 1931 being 792.

The causes of the deficiency of females in Sind are discussed in the 1931 Bombay-Sind Census Report at pages 116, 124-125, 128, 133, and 135. The gradual reduction of the proportion of Muslim to total population in Sind since 1881 is not to be ascribed to the influence of this factor so much as to extraneous causes mentioned above. It will be observed that their percentage in 1881 was considerably higher than in 1851, and it was not till 1921 that it fell below 74%, the figure recorded seventy years before.

XIV—VARIATION IN POPULATION OF SELECTED TRIBES

This corresponds with old Imperial Table XVIII, but the tribes included in 1931 were evidently selected with an eye to the Bombay Presidency rather than to Sind, no Muslim tribes appearing at all.

The figures for Kolis and Bhils alone appearing tended to stress an orientation of the province to the south and east, which is perhaps less important than that to the north and west; and I obtained permission of the Census Commissioner to add to the table figures for Baloch, Brahui and Jatt (camel-owner) tribes.

Previous figures for Baloch and Brahui are available from Imperial Table XVII.

The interest attaching to the Jat tribes is mainly bound up with their traditional means of livelihood, i.e. to what extent they continue to depend on camel breeding and camel transport for their living. Unfortunately, the "means of livelihood" table could not be compiled, and this information, like so much else, lies "buried" for the present.

BHIL.

The total population of this tribe has increased from 67,963 to 82,118, or by 21 per cent.

As in 1931, they are most numerous in Thar Parkar district, but their relative increase there is trifling, while in Hyderabad they have risen from 7,330 to 16,560, or by 126 per cent. A notable feature in this increase is that while the 1931 figure was made up of 6,325 males to 1,005 females, in 1941 the relative numbers of the sexes are almost in their normal proportions, 8,943 males to 7,617 females.

This may indicate a tendency, ever since the Barrage canals opened, for these people to settle on the land as Haris, instead of wandering about looking for casual labour, doing cotton picking etc., and then returning to their old homes in the Thar. The increase in their numbers in Nawabshah is also notable—over 33%.

But looking back to 1921, we find 13,500 Bhils recorded in Hyderabad district that year, or only 3,000 less than in 1941; which shows that the marked increase there over the 1931 figures may not only be ascribed to the attraction of Barrage irrigation as such, but also as reflecting conditions in the Thar.

It must be remembered not only that 1940 was almost a famine year in the Thar but that in the countries to the eastward—Marwar, Palanpur, etc., where Bhils are numerous, scarcity conditions have prevailed for several years. A considerable number of the Bhils who were recorded in Sind in 1940-41 census period were probably inhabitants of Rajputana States who had migrated to Sind to find a living, and would return to their own country as soon as good rain falls there.

The few Bhils found west of the river Indus make their living as casual labourers and hunters, and like other wandering people are constantly under suspicion of responsibility for any petty theft that occurs.

In general, however, the Bhils despite their wild appearance are well behaved, and it appears that they are considered true Hindus by the indigenous Hindu population, though their religion has usually been recorded as "tribal" in the past. If the criteria suggested by Mr. Dracup, on page 356 of the 1931 Bombay-Sind Census Volume were applied, the great majority of them would still have to be reckoned as "tribal" in religion.

The majority of Bhils speak Thareli or Dhatki, the dialect of Sindhi characteristic of the Thar. They do not mix with other tribes, but live in their own hamlets and encampments, in huts of wattle and grass matting. Like other Hindus, they marry within the caste but not within their own "Nukh".

KOLI

The number of these people has increased from 60,562 in 1931 to 101,456 in 1941.

They, like the Bhils, are most numerous in Thar Parkar district: but their increase there, though by more than 50%, is as nothing to Hyderabad, where they have risen from 16,849 to 40,455, or by 140%. The figure for this district in 1921 was 17,000; and 27,000 in Thar Parkar: where they have now risen to 54,000.

The phenomenon noticed in regard to Bhils in Hyderabad district recurs among the Kolis: viz. in 1931 there were 11,492 men to 5,357 women recorded, but in 1941 the proportions are almost normal—21,652 men to 18,803 women.

The Kolis are cultivators and labourers; of their three main divisions, the Parkaris are mostly regular Haris, and the Mewasis and Waggers, coolies and agricultural labourers. Some collect "lac".

Since the Barrage canals opened, Kolis have tended more and more to settle on the land instead of wandering about, doing cotton-picking, earth work, and similar labour. Hindu zemindars in Hyderabad district have lately encouraged them to become their Haris.

This however alone does not explain the very heavy increase in the number of Kolis in Hyderabad district. The 1941 figure must include many temporary immigrants from Cutch, and to a less degree from Marwar, Palanpur, and even Guajarat, who have been driven from their ordinary homes by long continuing scarcity there. This must also have contributed to the substantial increase in their numbers in Thar Parkar district.

The Kolis, like the Bhils, are accepted in Sind as true Hindus. They speak Gujarati, Thareli, or Kachhi (mainly the former) and live in their own villages. Where these are permanent, they affect the round "beehive" type of construction for their huts; and like the Bhils they marry within the caste, but outside the "Nukh".

BALOCH

At first sight, the figures of the people of this race recorded in Sind in 1941 seem to show an even more remarkable increase in the preceding decennium than the Kolis, *i.e.*, about 75% over the figures of 1931; and it might be assumed that the attractions of Barrage irrigation have occasioned a huge influx from the barren hills of the Mari-Bugti country, or the arid plains of Kachhi.

But though a certain amount of immigration from these areas has taken place, it is obvious that another explanation must be sought; and it will be found by reference to the figures of Balochis in Sind in the years 1921 and 1911.

In 1921 they amounted to 607,714 and in 1911 to 613,691: the decrease in that decennium being in accordance with that in the total population, due largely to the influenza epidemic of 1918-19.

There is no adequate reason for the recorded fall by 28% to the figure of 427,869 in 1931, as that decade was on the whole favourable.

The apparent rise by 75% in the decennium 1931-1941 is therefore misleading: if we omit the 1931 figures from consideration, we find the increase in the twenty years since 1921 to be just under twenty per cent; which is a moderate and natural amount.

Moreover, the 1941 figure of 748,797 represents roughly 23% of the total Muslim population of the Province, and we find that the 607,714 Balochis recorded in 1921 constituted 25% of the Muslim population of that year: while the proportion recorded in 1931 was only 15%.

It seems necessary therefore to reject the 1931 figure as entirely erroneous.

Classification of the Muslim castes and tribes of Sind has been found a difficult problem by all Superintendents of the Bombay-Sind census: and the instructions to enumerators in 1931 were not helpful in this behalf: *i.e.*, "For Mohammedans just as for Hindus, you should record them as Sheikh, Sayyed, Pathan, Pinjara, Bohra etc. The word Sindhi should on no account be accepted as a caste name, but all Mohammedans returning the word Sindhi should be asked what kind of Sindhi, and the name given by them recorded."

I have not been able to find what instructions the sorters in the 1931 Abstraction Office were given, for evolving figures of Balochis: but one must presume that many of the tribal names returned (and Balochis in Sind often call themselves by the name of a sub-tribe) were not recognised as Baloch in the 1931 compilation. On the present occasion the instructions to the enumerators were as follows:—

"The general rule in regard to this question (race, tribe or caste) is for enumerator to put down

The object of these elaborate instructions was to guard against Brahuis, Serais, and other classes who have long been living in the neighbourhood of Balochis in Sind, and have tended to adopt their customs, from getting themselves recorded as Baloch.

When the time for sorting arrived, I compiled a list giving the names of all Baloch tribes, and of those sub-tribes the members of which use their name rather than that of the tribe, which I had ascertained to be in current use in the Province, by personal inquiry in almost every part of it.

I therefore have reason to believe that the results are fairly accurate ; but if anything, more likely to be rather less than in excess of the truth.

DISTRIBUTION OF BALOCHIS

While the Kolis and Bhils in Sind are for the most part confined to the districts on the left bank of the Indus, and the bulk of the Brahuis, as we shall see hereafter, are to be found in those on the right bank, Balochis are scattered over the entire province, from Kasmor to the Indus delta, and from the hills near Karachi to those of Nager Parkar.

It may be noted in passing, that if we estimate their probable figure of 1931 at 10% in excess of that of 1921, it will appear that there are more persons of the Baloch race in Sind than in either Baluchistan or the Punjab, the figures for which were 229,473 and 624,691 respectively : in both of which provinces they occupy limited and fairly well defined tracts.

The creation since 1931 of the new district of Dadu makes it difficult to draw up an accurate set of figures by Sind districts for comparison ; but if it is assumed that Balochis formed about the same proportion to the total Muslim population in each of the two parts of old Larkana district, one of which remained as Larkana, and the other became the more important half of Dadu district : and, that the proportions in Upper Sind districts and Karachi districts were not seriously upset by their loss of certain areas, the table given below tends to indicate that the census of 1911 is reliable so far as Balochis are concerned :—

Proportion of Baloch to total Muslim population, in each district of Sind, and Khairpur State

District			1941	1931	
Dadu	28%	25% (approximate).
Hyderabad	25%	23%
Karachi	18%	19% area of district reduced.
Larkana	26%	25% (approximate).
N. wazirabad	21%	28%
Sohkotur	15%	16%
Tar Parker	23%	21%
Upper Sind Frontiers	37%	36% area of district reduced.
Khairpur State	18%	18%
Totals	23%	25%	

It does not appear, therefore, that the Baloch element in the population is increasing at as high a rate as the other Muslim elements : for though a certain number of Punjabi Muslims have immigrated into Sind since the Barrage canals opened, they cannot be as many in proportion to the indigenous non-Baloch Muslims as Baloch immigrants (including Makranis) to indigenous Balochis.

TRIBAL DISTRIBUTION AND ORGANIZATION

The tribes which may be held to belong almost exclusively to Sind are the Talpurs, (including Nizamanis), Chandias, Buledhis, and Karmatis.

Of these, the Talpurs and Buledhis have for many years been split up into entirely independent sections. The Talpurs, from the circumstances of their rule in Sind, have long abandoned the traditional Baloch tribal organization : but it retains much of its vigour in each of the Buledhis sections, under their respective chiefs.

The Chandia and Karmati tribes on the other hand have always recognized a single chief ; though the former are scattered throughout the province, the Tumandar is kept in touch with his tribesmen everywhere through their local " muqadims ".

Generally speaking, however, the Baloch tribes in Sind have not retained an organization comparable with that still in force among their neighbours in Baluchistan, where each tribe has been in occupation of homogeneous tracts of land for centuries.

The Tumandar of the Rinds (of Shoran in Kachhi) has practically made over the chieftainship of his tribesmen in Sind to his brother, who lives in Nawabshah district. The former is however looked up to as superior by members of the tribe, including sections like the Mastois and Jalbanis who have long since become virtually independent units : and a certain degree of deference to the chief of the rinds is paid by most other tribes, in virtue of the prestige attaching to him as the representative of Mir Chakar.

The Bugtis, Dombkis and Mazaris everywhere in Sind recognize the authority of their tumandar.

Others, like the Khosas, Jatois, Lagharis, Lunds, and Bozdars, who are numerous in Sind, have become almost entirely distinct from those sections of their tribe who remained in the lands they first acquired, under their tumandars, in Kachhi or Dera Ghazi Khan district ; and now look up to their own local sardars in Sind.

There is a tendency for Baloch tribes in Sind to lose their cohesion, and for muqadims of sections to set up as independent sardars. This has been noticed in respect of the Buledhis. Another instance is the Jamali tribe, which is very numerous and widely scattered in Sind : this has one sardar in Dadu district and another in Nasirabad tehsil of Baluchistan, each claiming the predominant position : while the Gabols have two sardars both living in the same place.

BALOCH SOCIAL CUSTOMS IN SIND

(i) *Tribal contributions.*—The system of " phori ", by which every tribesmen contributes something for the benefit of his chief, on occasions such as marriages or death ceremonies in the latter's family, is still followed in many tribes.

(ii) *Inheritance of land.* Among many tribes, the ancient custom of not allowing females to inherit land continues in force. The provisions of the *Shariat* in this behalf are sometimes nominally complied with by giving a female her share, with the assurance that she will make it over in absolute gift to a brother or other male relation.

An elder son in respectable Baloch families is generally given a share in addition to what is strictly his due, as " mehman-nawaz ", i.e., in recognition of his obligation to entertain guests. The object of these customs is to prevent fragmentation of family land.

(iii) *Marriage.*—The rule among Balochis continues to be, marriage as close in the family as possible outside the prohibited degrees. The ideal match is for a youth to marry his father's brother's daughter.

Failing first cousins, he will turn to remoter relations, and in the last resort to a family of the same " paro " or clan. Marriage beyond the " paro " is almost unknown among families of equal status.

In addition to this general endogamy, is occasional hypergamy : i.e., a Baloch of position will often marry a Brahui or Sindhi woman ; but the very poorest Baloch would not give a bride to a non-Baloch. The history of their race, both in Sind and in the countries they first occupied, affords many examples of the strictness of this rule.

The traditional social obligation on a Baloch husband to put his wife to death for infidelity is still widely observed, especially in Upper Sind and the border country, where the force of the custom is accorded recognition under the *Jirga* system of trial for such offences, and compensation is recovered from the paramour's family, in the event of his not being killed at the same time as the erring woman.

To prevent the continuance of blood-feuds between families which have thus fallen out, it was in the past customary for the *Jirgas* to recommend an exchange of marriageable girls between them : and in some cases, when a marriageable girl was not available on one side, bound the family concerned to betroth their next born girl to a boy of the other party. In these arrangements, family, section, and tribal responsibility was enforced. Of late years effect has not been given to such recommendations, as it is held that they are contrary to public policy.

(iv) *Shaping of children's heads.*—The Balochis are a brachycephalic race, but anthropologist should take into consideration the universal prevalence of the custom of aiding nature to produce the desired shape.

A Baloch mother will let her baby spend much of the first six months of its life, when the bones of the skull are still pliable, flat on its back with the head resting on the hard ground, from which position the child is prevented from rolling over. The effect is to flatten the back of the head to an almost absurd degree ; and by this means, it is held, a broad forehead and wide-spaced eyes, which are held in high esteem, will be produced.

OCCUPATION

The great majority of Balochis in Sind are zemindars and haris. Particular tribes or sub-tribes however depend more on their livestock than land : for instance, the Lunds of Dadu district ply camels for hire, and the Kapris (Marris) of Thar Parkar graze sheep and goats. Most of the Balochis located in the Western hills, and in the " Kachho " under them, gain their livelihood from their flocks and herds rather than from land, which in those tracts is unirrigated except for a minute proportion watered by hill streams.

It is in these areas that the traditional Baloch manner of life is best observed : *i.e.*, among the hill Chandias, Kalois (Lagharris), Bozdars, the Rustamanis Alikanis, Shahanis (Rinds), and Gabols.

The latter, for instance, appear at some remote period to have shared out the barren hill tracts which they occupy, assigning particular areas to particular "paros". The people of each "paro" wander about in their area, pitching their mat-tents according to convenience of grazing, but do not intrude upon the area belonging to another paro. In the event of scarcity, they migrate into Sind, and support themselves by selling their cattle, harvesting, and other casual labour : but return to the hills as soon as they hear that rain has fallen.

The Balochis who depend on flocks and herds for their living do not, in general, sell milk, which is contrary to their traditions : though this custom is no longer observed by those in the vicinity of such places as Karachhi.

Many of the hill-Balochis eke out their livelihood by selling mats of "pish" (dwarf-palm) and the women of many tribes in all parts of Sind weave "falasis" and camel-trappings for sale.

MAKRANIS

No attempt was made this year to produce separate figures for the Western Baloch tribes, commonly known in Sind by the territorial designation of Makrani.

These have long been prominent in Karachi city, and its vicinity, the figures for Karachi district in 1921 and 1931 being 12,084 and 11,939 respectively, out of totals for the province of 14,785 and 14,545.

These people depend on manual labour of all kinds, and numbers of them move into Eastern Sind for several months of the year, to work in cotton ginning factories : and seem to a considerable extent to be settling down there, maintaining themselves by harvesting and casual labour when the factories are not working.

LANGUAGE

As statistics of mother-tongue have only been evolved on a sample basis, one-fiftieth of the total population having come under review : and as the results cannot be correlated with race and tribe, only a few remarks may be offered on the subject. The conventional multiplication of the figure of 5,756 Balochi-speakers in Sind and Khairpur emerging from the sampling, by fifty, gives a total of 287,800 ; while the full census of 1931 showed 292,987 Balochi speakers in the province.

Comparison on such a basis is risky ; but if we proceed on the assumption that at least the number of Balochi-speakers has not shown an increase comparable with the increase in persons of the Baloch race, the reason is not far to seek.

While the language remains vigorous in Upper and Western Sind, and particularly in the hilly tracts, and while particular tribes or their sections are tenacious of their old tongue wherever they may be, there is in general a strong tendency to speak more and more Sindhi ; and the younger generation, particularly those who receive education, will often be found to know no Balochi, while their fathers and mothers' knowledge of the language is becoming "rusty".

Out of almost eight lakhs of people of the Baloch race in Sind, perhaps one quarter speak Siraiki—often differing little from Sindhi : and this is particularly marked among the tribes living in Sukkur, Nawabshah, and Thar Parkar districts. Others speak only Sindhi : and it is not infrequently found that in a single tribe, for instance the Chandias, particular sections speak respectively Balochi, Siraiki, and Sindhi as their mother tongue.

The Makranis are on the whole more tenacious of their mother tongue, Western Baluchi ; which differs a good deal from the Eastern and Northern dialect, and are disinclined to speak Sindhi.

BRAHUIS

The number of persons of the Brahui race recorded in Sind in 1941 was 82,326 as against 71,610 in 1931. But the 1931 figure must be rejected, as the returns for that year under "language" give a figure of 7,468 persons whose mother tongue was Brahuki : and it stands to reason that no one but a Brahui would speak this language as his mother tongue.

It is therefore difficult to make deductions from a comparison of the 1931 figures by districts for persons of the Brahui race, with those of 1941 : and only a few general inferences will be suggested.

At each decennial census since 1901, the Baluchistan authorities have noticed with concern the growing tendency of their people, and particularly the Brahuis, to settle in Sind.

That this process is on the increase is certain ; but its exact assessment is extremely difficult.

The census is always held at a time when a substantial number of the inhabitants of Baluchistan will be found in Sind on their regular annual cold weather migration.

The Brahuis censused in Sind therefore always comprise a large number of these migrants, in addition to permanent settlers. If the census were held in, say, May, only the latter would be found: and there is really no justification for considering the former as part of Sind's population, even though they may spend nearly as many months of each year in this province as in their homelands.

The difficulty is to differentiate the two. In the 1931 Census Report, under the heading "Immigration", we find that the term meant "residence in the Bombay Presidency on the night of the census of a person born outside Bombay Presidency", and the then Superintendent admits that this will not throw much direct light on the question of immigration. Three types of immigration are recognized: periodic, semi-permanent, and permanent. The Brahuis censused in Sind comprise all three classes.

According to the 1931 Bombay-Sind Census, the number of persons with a Baluchistan birthplace found in Sind was only 35,449; the figures for 1921, 1911, and 1901 being 54,352, 69,373 and 65,609 respectively. The 1931 Baluchistan Provincial Census Superintendent shows conclusively that the 1931 figure is far too low.

In 1941, tabulation for birthplace and mother tongue was done, as for the majority of the tables, on the basis of sampling of 1/50th of the enumeration slips, the sample slips being extracted in a manner to secure the greatest possible degree of randomness.

From these samples, amounting to 90,439 for the whole of Sind, we find 508 males and 232 females returning a Baluchistan birthplace. Assuming that these are actually 1/50th of the total, we obtain the figure 37,000. Similarly, we find 403 males and 331 females returned as speaking Brahuiki as their mother tongue, which gives a calculated total of 36,700. The coincidence is at first sight striking; but these figures are quite misleading. They show only 47, or a calculated total of 2,350, Brahuiki speakers for the whole of Larkana and Dadu district, which are notoriously the areas in which Brahuis are most numerous. It is evident that sampling in this manner may fail, through pure chance, to produce representative figures: but I am inclined to think that the main reason why this result is so much below the known probability is that many enumerators failed to take sufficient pains in asking and recording the answer to these questions in 1941, as they seem to have done in 1931 as regards birthplace.

Even if we arbitrarily doubled or trebled these obviously incorrect figures, we should not be any nearer to solving the particular problem, namely, to what extent are Brahuis settling permanently in Sind.

With a view to elucidating this question, which is of mutual interest to the two provinces, I attempted to ascertain the number of seasonal immigrants, *i.e.*, those who intended to return to Baluchistan after the cold weather, by ordering them to be recorded in separate enumeration pads: but it is evident from the figure returned—17,500—that these orders were not everywhere carried out.

Something may be gleamed from the numbers of "houseless" or "floating population" returned in the district summaries for the areas most affected by seasonal immigration from Baluchistan *viz.*, Larkana, Dadu, Upper Sind Frontier and Sukkur districts. It may be observed that the proportion of "houseless" to "household" population in Larkana and Dadu districts amounted to 3% as against 1½% in every other district except Thar Parkar, which is also affected by immigration from Marwar, Palanpur and Cutch.

The floating population enumerated in the four districts first named amounted to 44,000. But even if we may take $\frac{2}{3}$ of these, or 30,000, to be Brahuis, this figure is still in my opinion much below the probable number of these seasonal immigrants.

It is in fact difficult for enumerators to elicit from these people, who are in general uncouth and suspicious, what their movements are likely to be: and as they often remain in the same encampment for several months of the cold weather, enumerators must often have succumbed to the temptation to record their details at the same period and in the same enumeration pads as the house-hold population in the vicinity, instead of in the three days reserved for enumeration of the floating population, and in the pads reserved for seasonal immigrants.

Another difficulty for enumerators in this matter probably arose from the fact that more and more Brahuis tend to become "semi-permanent" immigrants. They will stay in Sind for one hot weather, perhaps two or more: first intending to return to the hills when they have saved enough money, and then rather turning their thoughts to devoting it to buying land in Sind. Such people still live in temporary shelters or tents, but they are no longer seasonal immigrants, though it is very difficult to distinguish them from these latter.

The resulting failure to ascertain the number of Brahu temporary immigrants is the more regrettable as the Superintendent of Census, Baluchistan had expressed particular concern about it, and I had devoted considerable care to the framing of instructions in the matter. It may be added that more satisfactory results would probably have emerged had the sorting of all enumeration slips been performed in the Central Abstraction Office by the trained staff. As this was impracticable on the score of expense, this work so far as the rural and smaller urban charges were concerned was entrusted to the taluka staffs.

I am of opinion that the only satisfactory method of determining the extent to which Brahui migrants are settling in Sind would be to station enumerators on the routes which they follow, e.g., the Bolan, Mullah, Harbab and Phusi passes, for the months of October and November, and again in March and April, to count the number going down and the number coming up.

The number by which the latter figure fell short of the former would represent the people settling either semi-permanently or permanently in Sind : but it would not be possible to differentiate between these two classes.

The population of Baluchistan recorded at this Census was 850,000, showing a fall of 18,000 from the totals of 1931 : but the deficiency in Kalat State amounts to 69,000, and the figure of Brahuis returned for the whole of Baluchistan was 128,336 as compared with 152,588 censused in 1931.

Referring once more to the 1941 Sind district figures of Brahuis, the increases in Nawabshah and Thar Parkar in particular are notable. These districts are beyond the ordinary range of the seasonal immigration, and there can be little doubt but that the demand for haris, for factory labour, and for camel-transport occasioned by the development of the Barrage canals, is attracting permanent Brahui settlers. There was already a nucleus of land-owning Brahuis in Nabwabshah district : and in Shahdadkot taluka of Larkana District I found that many Brahuis had purchased small holdings of Barrage land on a family basis, and were considered efficient cultivators.

The substantial increase in their numbers recorded in Karachi district, from 6,071 to 10,178, requires some explanation. Irrigation has been developed in the Tatta division in the last ten years. There are a number of Brahui villages of considerable standing in Tatta taluka to which their fellow tribesmen are probably attracted. This taluka accounts for 2,468 of the district total.

Similarly in Karachi taluka, Brahuis have long been well-established, chiefly in the immediate neighbourhood of the city : e.g., Mangho Pir, Malir, Darsano Chano and Landhi. Karachi's demand for market garden produce, and milk is ever on the increase, and transport by motor lorry has by no means superseded the camel. The trade in " pish ", or dwarf palm, between southern Jhalawan and Karachi also continues to flourish, and its transport is almost exclusively carried on by Brahuis.

Thus the figure of 5,550 Brahuis in Karachi taluka may be readily accounted for.

The number of Brahuis in Karachi municipal district amounted to 1,824 : they are mostly labourers, camel drivers, and artisans.

There was a fall in the numbers returned from Dadu district, from 13,536 in 1931 to 11,503 in 1941. The former number was of course calculated on the basis of the boundaries of the subsequently constituted district.

Being the area most subject to seasonal immigration, the decrease does not call for particular remarks. 7,806 of the total was recorded as " floating population ".

The falling off in Upper Sind Frontier may be ascribed to the same causes : viz., the fluidity of immigration. Larkana district between Upper Sind Frontier and Dadu, shows an increase of 4,925.

SOCIAL CUSTOMS

The Brahuis being essentially a race belonging to Baluchistan, their social customs need only be mentioned so far as they have a bearing on their sojourn in Sind.

Like the Balochis, people of different Brahui tribes generally camp in separate places ; or if settling altogether in Sind, build separate villages. This applies also to sections, and sub-sections of tribes. The inhabitants of a particular valley in Jhalawan, if belonging to the same section or sub-section, will probably journey and remain together while in Sind. They usually travel complete with their tents (" gidans ") beds, grind-stones, cooking apparatus, spinning wheels and all household belongings, loaded on bullocks and donkeys : on these beasts of burden are also carried children, old and infirm members of the family ; kids, lambs, and puppies unable to keep up on the march : and chickens. The Brahuis almost always take their women and children on their migrations, a practice quite contrary to that of the Pathans : but a few men generally stay in their own country to look after those cattle, etc., which are not brought into Sind, and the crops which they leave to ripen.

Many sections or families tend to make for the same place in Sind each year, having established a sort of labour connection in the area.

They camp either in their " gidans " (blanket tents) or in shelters which they build out of brushwood or grass mats, remaining in each place for so long as the men can find work, and moving on when it is finished.

The move into the plains begins in October, and they return to the hills in March or April, often staying in Sind until the rabi harvest is over.

Until recent years, the Brahmuis were accustomed to sell their girls to Baluchis and Sindhis in marriage : being for the most part very good looking in youth, the market was brisk, and the temptation to make easy money too great to refuse. His Highness the Khan of Kalat has, I believe, ordered all Brahmui Sardars to put a stop to this practice, which must have become an important contributing factor in that decline of the numbers of their race in its ancient habitat, and disintegration of the tribal system, which was remarked by Sir Denys Bray in 1911.

If, as Brahmuis themselves declare, they have discontinued this practice, it will be interesting to see in 1951 whether the race has at all recovered its lost ground.

Adding together the figures of Brahmuis enumerated in Baluchistan and Sind in the previous three censuses (Sind's figure for 1931 being that of Brahmui speakers) the totals are :—

			1931	1921	1911
Baluchistan	152,588	159,731	167,787
Sind	79,561	51,737	60,389
		Total	232,149	214,471	228,176

—it does not therefore appear that during this period the Brahmuis as a race were declining in vitality. The drop between 1911 and 1921 reflects that recorded all over India, being the result mainly of the influenza epidemic. On the other hand, the rise during the favourable decade 1921—1931 was 15,768, giving the respectable figure of 8%.

But the corresponding figures for 1941 certainly indicate that the apprehensions of the Baluchistan authorities are well founded. As mentioned above, people of the Brahmui race enumerated this year in Baluchistan amounted to 128,336. The Sind figure was 82,326 : and the total for both provinces, of 210,662 shows a decrease by 21,487 or nearly 10% from 1931.

Some allowance must be made for errors and omissions resulting from the "amateur" compilation in the Sind taluka offices which had to be resorted to on this occasion ; and we must take into consideration the possibility that a certain number of Brahmuis in Sind have given, in reply to the question "What is your Race, Tribe or Caste ?" Tribal names which have not been recognized by enumerators as belonging to the Brahmui race.

But whatever the tendencies in the race as a whole, it seems certain that they are resorting to Sind as permanent and semi-permanent immigrants to an ever-increasing degree.

OCCUPATION

The Brahmuis who are permanently settled in Sind are zemindars, cultivators, engaged in camel-transport, blacksmiths and "kalaigars", or labourers.

The seasonal immigrants engage chiefly in levelling Sind zemindar's fields by means of "keens", for which they bring their oxen : working in the rice-husking factories : harvesting : and other casual labour.

As mentioned above, they often establish regular relations with zemindars and employers of casual labour in particular localities, and come for work there year after year.

The women make and sell "pish" mats : and also spin goats' hair and wool and weave "falasis", "kurjins", etc. for sale.

LANGUAGE

The figures of Brahmui speakers in the province calculated from the 1/50th samples sorted for mother-tongue, only amount to about half the probable total. Brahmuis who visit Sind rapidly become bi-lingual and the probability is that many returned Sindhi as their mother tongue when it was only their secondary language. Association with Sindhis is liable to produce on Brahmuis the impression that their tongue is uncivilized.

TRIBES AND HOME COUNTRY OF BRAHMUIS FOUND IN SIND

Most of the Brahmuis found in Sind hail from the Jhalawan province of Kalat State : and the Mengal and Zahri tribes supply the great majority.

The following among others are also regular visitors : Muhammad Hassanis, Bisanjavs, Sasolis, Bajois, Jattaks (permanent near Tatta) and Pandranis : the last mentioned being largely settled permanently in Upper Sind.

A fair number of Sarawan tribesmen are found, for instance Lahris and Langavs.

JATS OF JATI AND SHAHBUNDER TALUKAS

The Jat tribe in the Delta of the Indus have given their name to Jati taluka, and may be considered indigenous, and probably among the "oldest inhabitants" of Sind.

The Malitani section, which is associated exclusively with this taluka, have their headquarters at Raj Mahk, where their Chief lives; but they have no permanent villages. They wander about the taluka with herds of female camels, remaining in one spot only for so long as there is sufficient grazing in the vicinity. Their encampments are known as "Wandhs", and consist of huts made of grass matting.

These people are exceedingly primitive in their customs. They live almost entirely on their she-camels milk, and hardly ever eat bread, or even drink water, incredible as this may seem. They sell the male calves of their camels at fairs, but it cannot be said that they really depend on breeding for sale for their "livelihood".

The sections of the Jats living in Shahbunder taluka, particularly the Fakiranis, follow a similar manner of life.

This tract in the Delta of the Indus is peculiarly suitable for grazing camels, as their favourite "khabar" bush grows profusely everywhere, and the areas under cultivation are very restricted.

The language of these Jats is considered to be Seraiki, but their dialect is peculiar and merits investigation by philologists. It would hardly be intelligible to the "Sindhi-Seraiki" speaking people of North Eastern Sind.

OTHER JAT TRIBES

Tribes such as the Lishari and Jiskani, and many more, are scattered all over Sind and are ordinarily engaged in camel transport, though some own land. They generally have permanent villages where their families stay, while the men spend most of their time transporting grain, etc., from one place to another. Some contract with merchants or Government servants for their transport work over a period of time: others move from one place to another picking up loads wherever they can. Thus Jats belonging to Kotri taluka will be found as far east as Mirpurkhas, and as far north as Larkana.

It follows that the distribution of the people of this race, as it appears from the district totals under this table, has no particular significance; the addition of details of birthplace would be necessary before any conclusions could be drawn.

Almost all Jats speak Siraiki among themselves, though they use Sindhi in dealing with their clients. Many of them also speak Balochi, having been associated in former days with the Baloch tribes as their camel-drivers. There is a marked tendency among these Jats to claim Baloch origin, and a number of their tribes would seem, from the very appearance of their men, to have received a strong infusion of Baloch blood. The Hypergamous Baloch will sometimes marry a "Jatni", though the formal tie is often dispensed with. Students of Baloch legendary history will recall that the war of the Rinds and Lasharis was mainly due to the rivalry of the two Chiefs of these tribes, Chakar and Gwahtam, for the favours of Mai Gohar, a rich camel-owning Jatni.

The women, and occasionally the men, of the Jat tribes weave falasis out of camel hair, with which they mix goat hair and wool.

Like the Balochis, Brahuis, and the majority of the Sind Muslim tribes, the Jats are accustomed to mould the shape of their children's heads in infancy.

PROVINCIAL TABLE I--AREA AND POPULATION OF TALUKAS.

1. Considerable changes in the internal divisions of Sindh have occurred since 1931, due to the creation of a new district, Dadu. It is not possible to get accurate figures for the areas of talukas and consequently taluk densities have not been worked out in this table.

2. The effect of the Barrage on population in Sind, which cannot be gauged from the district totals in Imperial Table II, is at once apparent when comparative figures for talukas are reviewed.

DADU DISTRICT

Considerable increases might have been expected in *Dadu* and *Johi* talukas, which prior to the opening of the Barrage were irrigated by the tail reaches of the Western Nara canal. But the gain in population here is a mere 9%, far less than their increases in the decennium 1921-1931.

Kakar on the other hand shows a 20% gain, though this Taluka, like Mehar, was comparatively well irrigated by inundation canals in the pre-Barrage period.

The only significance of the 37% increase in *Kohistan Mahal*, is that the hill country received fairly satisfactory rain fall in the last year of the decade.

HYDERABAD DISTRICT

As was to be expected, *Tando Hukzar* taluka has gained enormously in population since the Barrage. This area was previously ill-served by inundation canals, much of it being beyond their command, while now the Nasir Branch flows right through the middle of the taluka on the high level. An increase in population by 50% is thus readily accounted for.

Dero Mohabbat, commonly known from its headquarters as *Matli*, exceeds this figure, with 62%, the highest rate in the whole of British Sind in the decade and the reasons for the increase are similar.

The 20% gain in Hyderabad taluka, maintaining that of the previous decennium, may be ascribed mainly to the growth of Hyderabad city.

Of the other talukas, *Hala* was comparatively well irrigated in pre-Barrage days, and its population has remained almost stationary, as compared with an increase by 19% between 1921 and 1931.

Tando Bigo, of which about a third now falls within the Barrage zone, maintains a modest 8% increase.

Of the talukas depending entirely on inundation canals, *Guni*'s population is almost stationary, after gaining by 20% in the previous decade, and *Badin*, at the tail of the Fuleli system has actually lost by 12%.

KARACHI DISTRICT

The 45% increase in *Karachi* taluka is nothing more or less than the increase in Karachi city.

The population of the mofussil, on the contrary, has actually decreased in the past ten years. *Ghorabari* had shown a heavy loss in the decade 1921-31, and a further fall has now taken place.

Jati and *Tatta*, which were both gainers in the previous decennium, have decreased to the same extent as *Ghorabari*: *Shahbunder* and *Sujawal*, which had registered respectable increases in 1921-31, are now stationary.

Keti Bunder has lost heavily: but the enormous increase recorded for this area in 1931 was probably due in the main to fortuitous circumstances.

The only talukas which show a gain in the past ten years are *Mirpur Bathoro* and *Mirpur Sakro*.

The irrigation facilities in the former area are probably better than in any taluka of the district; and in the latter, the development during the last ten years of the Nari Chach canal has attracted settlers.

It may be confidently affirmed that the general decrease in population in the district of Karachi is due to the effect of the Barrage: perhaps not so much as having an adverse influence on the functioning of the inundation canals in the area, as in the superior attraction of its perennial irrigation, and the demand for "haris" in previously thinly peopled tracts to the eastward, which have begun to thrive as never before.

Considerable improvements in the canal systems of the area have been carried out in the last few years, and it is hoped that they will have the effect of restoring prosperity to the district, and arresting the tendency of the people to look for a better livelihood elsewhere.

LARKANA DISTRICT

The talukas constituting the present district of Larkana were among the most prosperous in the whole of Sind in pre-Barrage days, under the Ghar and Western Nara canal systems. The exceptions were *Shahdadkot* (then part of Upper Sind Frontier) and *Warah*, served by the tail branches of the Begari and Ghar respectively.

The result of the introduction of Barrage irrigation has not unnaturally been to bring a considerable increase in population to these two talukas, while the others record figures indicating nothing more than the natural increase.

Shahdadkot has attracted a large number of Brahmuis from Kalat State, and Balochis from Nasirabad tehsil and Kachhi, especially the Magsi country, who have bought land and settled.

NAWABSHAH DISTRICT

Nawabshah district was a considerable gainer in the decade 1921-31, recording a 19% increase. This rate is not quite maintained in the decennium under review : but the percentage of increase continues to be high in all talukas except *Kandiaro* and *Sakrand*, where it is 8%. These areas were comparatively speaking well served by inundation canals.

Nawabshah shows the highest rate of increase, 35% ; but it had gained by 48% in the previous decade, and relatively *Moro* has prospered more, returning 22% as against 10% in the period 1921-31.

Sinjhoro's rate of increase has also advanced from 12% to 17%.

It is therefore evident that Nawabshah has benefited greatly from the introduction of Barrage Irrigation : though it can be seen most clearly in the increases recorded in its three towns, Nawabshah, Tando Adam and Shahdadpur.

SUKKUR DISTRICT

The gains of *Samaro* and *Sanghar* are also respectable.

Of the purely Desert talukas, *Chachro* continues to increase at a high rate ; 21% as against 22% in 1921-31. *Mithi* has almost become stationary, and *Nagar Parkar* records a loss by 22%. The increase in *Diplo* by 35% is almost entirely due to the opening of a canal in the strip between the Thar and the Dhor Naro.

It is difficult to account for the comparative prosperity of *Chachro*. The Thar has suffered much in the last two years, and part of the increase in the "Sind" tract of this district may be due to immigration temporary or permanent, of the people of the Desert :—not only of that portion which lies within Sind province, but from Marwar, Palanpur and other States which have been afflicted with scarcity during the same period.

In fact, it would not be safe to ascribe the increase in population of Thar Parkar district as a whole solely to the effect of the inauguration of the Barrage : though whatever the condition of the countries to the Eastward, the comparative ease of livelihood Sind now offers is probably having the same attractive influence in that quarter as on the inhabitants of Kalat to the westward.

UPPER SIND FRONTIER DISTRICT

About one half of *Garhi Khairo* taluka receives irrigation from the Barrage : and it is in this taluka that the population has increased at the highest rate—by 25%—in the decennium under review. It should be observed that the figure for the previous decade is a calculation, the taluka having been formed of parts of old *Jacobabad* and *Shahdadkot* talukas, with small portions from *Ratodero* and *Garhi Yasin*.

Jacobabad has also gained, and there is a slight increase in *Kashmor* over the previous figures. *Kandhkot*, though not maintaining its former high rate of increase, still gains by 17%, and thus all may be considered as increasing at more than the normal rate except *Thul*, the figure for which is 11%.

The prosperity in this non-Barrage district is due to constant local improvements in irrigation, and more particularly to the progressive removal of restriction on the growing of rice. From its position close to less favoured lands, it continues to draw a fair number of settlers from outside the province.

KHAIRPUR STATE

1931 Talukwar figures for Khairpur State are not available ; and moreover a new taluka, *Kot Diji*, has been formed only recently which would make comparison difficult.

The increase in population in the State as a whole, during the past ten years, outstrips that of any District in British Sind, amounting to 35%, or almost double the substantial rate of 18% recorded for the previous decade.

This growth may be ascribed in the main to the success of the Barrage Irrigation, under which *Mirwah* taluka in particular has developed greatly. Other causes too probably contribute to attract State subjects who had previously migrated in British India to settle again in Khairpur State.

PROVINCIAL TABLE II--POPULATION OF DISTRICTS AND TALUKAS BY COMMUNITIES AND LITERACY

According to the census of 1941, 389,339 males and 90,020 females in the province of Sind are literate representing 15.6% and 4.4% of the total male and female population respectively.

The corresponding figures for 1931 were 200,360 literate males and 29,359 literate females, the percentages to the total population of each sex being 9.2 and 1.7.

The increase in ten years of literate persons, by 188,979 males and 60,661 females—nearly double the 1931 number of males, and more than three times the number of females—is highly gratifying, and as a first step in examination of its causes the figures may be placed in opposition to those of educational institutions in Sind at the beginning and towards the close of the period.

EDUCATIONAL DEVELOPMENT DURING THE DECADE

The total number of schools in Sind in 1931 was 2,439. In 1939 it had risen to 2,812, an increase of 373, or by 15%.

The total number of pupils in the former year was 79,930 : in the latter year, 102,369, an increase of 22,439, or by 28%. In 1931, for every student attending school, there were nearly two literate persons outside : in 1941, the proportions have risen to nearly four to one.

This development is striking : it is nevertheless necessary to record the opinion of the Director of Public Instruction, that there is a vast amount of wastage in education in Sind : in other words, a substantial number of those attending school leave early, and do not retain what they have learned, but soon relapse into illiteracy.

Compulsory primary education was introduced in 1929 in Larkana taluka, and in the Lyari and trans-Lyari quarters of Karachi city in 1930. Towards the end of the decade, in 1939, it was introduced in Sukkur and Dadu talukas.

Another feature in the educational history of the decade was the literacy campaign inaugurated by the Honourable Minister for Education, in 1939, to stimulate adult education.

VALUE OF THE FIGURES

The census qualification for "literacy" on this as on former occasions was, ability both to read and to write, in any language : and persons able only to read were not to be classed as literate. In subsequent circular instructions, it was pointed out that the mere fact that a child was attending school, e.g. in the infant class, did not mean that it was literate.

It must not be assumed that these criteria were invariably explained by enumerators in their interrogation of persons whose qualification was *prima facie* doubtful : or that these latter would never claim to be literate simply on the strength of ability to sign their name. The value, or it may be termed the prestige, attaching to literacy is more widely felt now than it was ten years ago ; and it may be supposed that a substantial proportion of persons who had once known the rudiments of reading and writing, but have wholly forgotten them, may have claimed to be literate when questioned by an enumerator.

The degree of inaccuracy in the recorded figures due to this cause may perhaps have been greater than in 1931.

The whole question is most ably discussed by my predecessor at page 288 of the 1931 Bombay-Sind Census Report, to which I would invite reference. There is little doubt but that the census returns under literacy are always much in excess of the actual truth : but it is impossible to judge what proportion of the numbers recorded as literate ought to be discounted.

I may merely state my opinion that this excess was probably greater in 1941 than in 1931 : but subject to this assumption, a direct comparison may usefully be instituted between the two sets of figures, as whatever the degree of error, the influences likely to produce it are the same now as then.

The relative figures for the scheduled (depressed) classes disclose an exception : it may safely be concluded that they were far too optimistic in 1931, and that the returns for 1941 are, at least, nearer to the truth.

Education among the Scheduled Castes has made most progress in the city of Karachi, where the sweeper class are well looked after by the Corporation. This explains the relatively high literacy percentages of 11 and 1.5 for males and females respectively under Karachi district. Elsewhere, the figures are disappointing : but it must be borne in mind that a substantial proportion of the people of these classes are temporary visitors, recent arrivals in Sind from adjacent countries where education is even more backward. This total population was returned as almost double that of 1931, and this must have had the effect of lowering the percentage of literacy. Parkar (0.003) and Hyderabad (0.006) may be considered as largely the effect of such immigration.

Sikhs.—Sikhs in Sind are literate to about the same degree as Hindus, and like the latter community, they have their backward class. These are the Labanas, who are extremely poor and ignorant ; and their almost complete illiteracy in the Sikh community during the decade has been gratifying.

Jains.—The total numbers of this community are shown to have increased during the decade : among males, the percentage of literacy has fallen, while it has risen among females. But the total number of Jains is so small that it is not possible to gauge the significance of these changes.

Christians, Parsees, Jews.—These communities have maintained their previous high standard of literacy, which is now almost equal for males and females : the latter having advanced from 51% to 61%.

LITERACY IN ENGLISH

The qualification for English literacy was ability to read a letter in that language and write a reply to it. This was expressly stated in the instructions to enumerators, but it is not to be supposed that it was invariably explained, or that all who claimed to be literate in English could have passed such a test.

However this may be, the advance in English literacy during the decade was substantial ; far greater than in the two previous decades, as will appear from subsidiary Table XI (ii).

The majority of persons literate in English are, of course, to be found in the towns : but no one who toured through the province in 1931 and again in 1941 could fail to be impressed by the comparatively considerable amount of English that is now to be heard spoken in the mofussil.

LITERACY BY DISTRICTS

The proportion of literate to total population in the districts of Larkana, Hyderabad, Dadu, Nawabshah and Thar Parkar, Dadu and Nawabshah and Thar Parkar. Between them the order is, (for males)—Sukkur, which the census is held, of generally illiterate elements from the adjacent countries, and on this occasion Thar Parkar and Hyderabad were probably more affected than others.

KHAIRPUR STATE

The extent of literacy in Khairpur State appears to be much below the general average for British Sind. It approximates for males to that of Upper Sind Frontier district, which as we have seen occupied the lowest position in the order of Sind districts : female literacy in the State falls far short of the Upper Sind Frontier figure. In fact, the proportion of literate females to total females in Khairpur is lower than in 1931, and among Muslims an actual decline from 247 to 143 literate females has taken place. Among Hindus, male and female, an advance is recorded. In English literacy, on the other hand, the State has the advantage over Upper Sind Frontier.

SAMPLE TABLES VI, VII, VIII, XI AND XII

This census has seen the beginning of random sampling. Every 50th slip in Sind was taken out during the main sorting. Only Imperial Tables I to V, XIII and XIV have been sanctioned on this occasion but opportunity has been taken to sort the sample slips for Tables VI, VII, VIII, XI and XII.

One fiftieth of the population of Sind is 90,700 ; the number of slips in the sample batch is 90,439.

2. The community table shows the following community proportions :—

Hindus	27.1%
Muslims	70.8%
Others	2.1%

The community proportions according to the sample are :—

Hindus	28.0%
Muslims	70.7%
Others	1.3%

The sample shows an agreement within 1% and in the case of the majority community there is a difference of only 0.1%.
